#### 0.4.2 Data Definitions

```
[9]: # IBD_def = pd.read_excel("../Data/Column_Definitions.xlsx", sheet_name="IBD")

[10]: # IBD_def[["Data Column", "Definition", "In depth understanding"]]

[11]: cleaned_cases = cleaned_cases.drop(['Year', 'Lab No', 'Method of confirmation',
↪ 'Initial pathologists diagnosis', 'Observing pathologists diagnosis'],axis=1)
```

#### 0.4.3 Data Manipulation

**IBD Stages:** Since the stages of UC is determined by the severity of symptoms, the classes are manually added based on symptoms.

Use decision trees to determine

Perhaps find a doctor who can provide some expertise into the stages? - check if this is possible (we would need multiple people to have statistically significance)

**Data Transformation** Since the data is already dummy coded, the transformation of it will be required for understanding the outcome after modeling.

```
[12]: transform_dict = [{"data": ["Mucin depletion", "Crypt architecture"],
                        "definitions": [{
                            0: "Normal",
                            1: "Mild",
                            2: "Moderate",
                            3: "Severe"}]},
                        {"data": ["Cryptitis extent", "Crypt abscesses extent"],
                        "definitions": [{
                            0: "None",
                            1: "Little",
                            2: "Moderate",
                            3: "Marked"}]},
                        {"data": ["Lamina propria polymorphs"],
                        "definitions": [{
                            0: "Absent",
                            1: "Focal",
                            2: "Diffuse"}]},
                        {"data": ["Cryptitis polymorphs", "Crypt abscesses_
↳polymorphs"],
                        "definitions": [{
                            0: "None",
                            1: "Few",
                            2: "Several",

```

#### 0.4.4 Data Cleaning

**Clean Diagnosis:** Strip data and Upper Case and ensure spelling of all are correct to prevent any separation of classes which are unnecessary.

```
[16]: print(cleaned_cases['Confirmed diagnosis'].unique())
      cleaned_cases['Confirmed diagnosis'] = [c.strip().upper() for c in
      ↪ cleaned_cases['Confirmed diagnosis']]
      print( cleaned_cases['Confirmed diagnosis'].unique())
```

```
['UC' 'Crohns' 'Crohns ' 'Uc']
['UC' 'CROHNS']
```

```
[17]: #cleaned_cases.columns
      #cleaned_cases["Method of confirmation"] = [x if x != "Endosocpy" else
      ↪ "Endoscopy" for x in cleaned_cases["Method of confirmation"]]
      #cleaned_cases["Method of confirmation"].unique()
```

```
[18]: #cleaned_cases['Observing pathologists diagnosis'].unique()
```

```
[19]: #cleaned_cases['Initial pathologists diagnosis'].unique()
      #cleaned_cases['Initial pathologists diagnosis'] = [d if d != "IBD ?Crohn's"
      ↪ else "IBD ?Crohns" for d in cleaned_cases['Initial pathologists diagnosis']]
      #cleaned_cases['Initial pathologists diagnosis'] = [d if d not in
      ↪ ["Non-specific inflammation,chronic", "Non-specific inflammaton, chronic"]
      ↪ else "Non-specific inflammation, chronic" for d in cleaned_cases['Initial
      ↪ pathologists diagnosis']]
      #cleaned_cases['Initial pathologists diagnosis'].sort_values().unique()
```

```
[20]: #cleaned_cases['Year'].sort_values().unique()
```

#### *Missing/Duplicate Data Checks*

There is no duplicates data

```
[21]: print(f'IBD duplicates: {cleaned_cases.duplicated().any()}')
```

IBD duplicates: True

There are no missing data values

```
[22]: print(f'IBD missing: {cleaned_cases.isnull().values.any()}')
```

IBD missing: False

#### 0.4.5 Train Test Split

Cross and coworkers randomly shuffled the dataset and split the first 540 cases as the train set and the lasts 269 cases as the test set.

```
[23]: X = cleaned_cases.drop('Confirmed diagnosis',axis=1)
y = cleaned_cases['Confirmed diagnosis']
X_train,X_test,y_train,y_test = train_test_split(X,y,test_size=269,
↳random_state=123)
print(f'Train set has {X_train.shape[0]} rows and test set has {X_test.
↳shape[0]} rows')
```

Train set has 375 rows and test set has 269 rows

Class Imbalance

The minority class of healthy was oversampled so that there were equal diseased as unhealthy classes. This is also reflected in graphs below.

```
[24]: Counter(y_train)
```

```
[24]: Counter({'UC': 285, 'CROHNS': 90})
```

```
[25]: #Counter(cleaned_cases['Initial pathologists diagnosis'])
```

EDA

## 0.5 ##### Jamie

The age is skewed towards the younger generations, and there are outliers of age under 15 and above 85. Since there is no proof that these age groups are errors opposed to only having a low count, they will be left in the data.

```
[26]: plt.figure(figsize=(10,10))
sns.distplot(cleaned_cases.Age.values, bins=50, kde=True)
plt.xlabel('Age', fontsize=12)
plt.show()
```

C:\ProgramData\Anaconda\lib\site-packages\seaborn\distributions.py:2557:  
FutureWarning:

`distplot` is a deprecated function and will be removed in a future version. Please adapt your code to use either `displot` (a figure-level function with similar flexibility) or `histplot` (an axes-level function for histograms).

The data below shows that majority of the cases are from years 90-92 and 95-96. The other years have minimal contribution for years prior to year 90.

```
[27]: #plt.figure(figsize=(10,10))
#sns.distplot(cleaned_cases.Year.values, bins=50, kde=True)
#plt.xlabel('Year', fontsize=12)
#plt.show()
```

While the data is a mixture of both histology and endoscopy, but majority of the confirmation methods are endoscopy.

```
[28]: fig = px.histogram(cleaned_cases, x="Age", color='Sex')
fig.show()
```

Distribution of the dataset, where majority of the classes are UC and the remaining are split to normal and UC roughly evenly.

```
[29]: cd_gb = cleaned_cases.groupby("Confirmed diagnosis").count().reset_index()
fig = px.bar(cd_gb, x='Confirmed diagnosis', y='Sex')
fig.show()
# cd_gb
```

```
[30]: fig = px.histogram(cleaned_cases, x="Age", color='Confirmed diagnosis')
fig.show()
plt.figure(figsize=(10,10))
```

```
[30]: <Figure size 720x720 with 0 Axes>
```

```
<Figure size 720x720 with 0 Axes>
```

### 0.5.1 correlations

The correlation matrix is show below, which is no the same method which is used for continuous variable, but rather categorical variables.

```
[31]: corr_matrix = cleaned_cases.apply(lambda x : pd.factorize(x)[0]).
↳ corr(method='pearson', min_periods=1)
corr_matrix.head()
```

```
[31]:

[5 rows x 25 columns]

We see strong correlations between the symptoms. Specifically, there is a strong correlation between active inflammation and lamina propria polymorphs, which is investigated further below.

Many of the correlations are intuitively connected. For example, cryptis polymorphs and extent, since they are both related to the the fact of where there is inflammation in the linings of the stomach to the morphed cells of the glands.

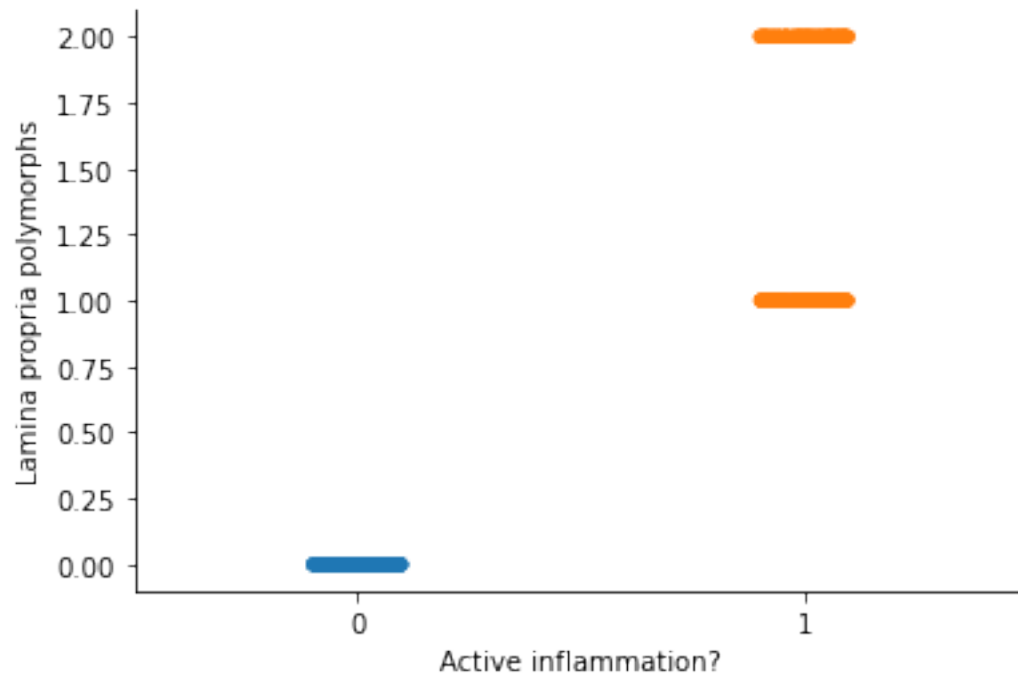

One interesting obervation is the correlation of epithelial changes and the mucin depletions since the epithelial layer concerns the outter layer of the intestine and the mucin depletion primarily concerns with the inner side of the organ.

```
[32]: fig = px.imshow(corr_matrix)
fig.update_yaxes(visible=False, showticklabels=False)
fig.update_xaxes(visible=False, showticklabels=False)
fig.show()
```

### *Active inflammation and lamina propria polymorphs*

Overall, the active inflammation makes sense considering if there is no inflammation, that there in turn would have no polymorphs. Since the inner linings are typically only shows to morph when there is inflammation, this is intuitive in the results.

```
[33]: sns.stripplot(x='Active inflammation?', y='Lamina propria polymorphs',
↳ data=cleaned_cases, jitter=True)
sns.despine()
```

```

```

**Odds Ratio** Odds ratio is a measure of association between an exposure and an outcome. The OR represents the odds that an outcome will occur given a particular exposure, compared to the odds of the outcome occurring in the absence of that exposure. [source](#)

There is no strong correlations between the two, that if a patient is of a specified year and age, there is a 1:1 ratio of the patient being diagnosed with UC of chrohns.

```
[36]: # odds ratio calc
uc_ch = cleaned_cases.loc[cleaned_cases["Confirmed diagnosis"].isin(['UC', 'CROHNS'])]
table_uc = uc_ch[["Confirmed diagnosis", "Sex", "Active inflammation?"]].groupby("Confirmed diagnosis").sum()#.values
print(table_uc)
```

```
oddsratio_uc, pvalue_uc = stats.fisher_exact(table_uc)
print("OddsR: ", round(oddsratio_uc,4), "p-Value:", pvalue_uc)
```

```

```

For unsupervised EDA, The objective is to find multiple symptoms that are all 1 for the same patients and are all 0 for other patients.

First, manually calculate the risk ratio between Symptom A and Symptom B

Next, create a cross tab where the row is Symptom A, the column is Symptom B and the cell value is the risk ratio of Symptom B / Symptom A

Finally, find the groups of symptoms that have highest risk ratios for one another. If 3 columns have high relative risk ratios, consider keeping only one of those columns and dropping the other 2

Risk Ratio

What is the risk of getting “Increased lamina propria cellularity” if you do have “Lamina propria granulomas” versus the risk of getting “Increased lamina propria cellularity” if you do not have “Lamina propria granulomas”?

If two symptoms are both positive in 1000 patients. And in another 1000 patients the two symptoms are negative. This would indicate correlation between those 2 symptoms.

```
[49]: exposure = 'Lamina propria granulomas'
disease = 'Increased lamina propria cellularity?'
risks = X_train.groupby([exposure,disease]
                        ).size()/X_train.groupby([exposure]).size()

```

In the below cross tab, the value in the second row, and in the fourth column (Increased Lamina propria cellularity\_1) is the number 0.894737. This means that 89% of the patients (in the train set) had both Basal histocytic cells and Increased lamina propria cellularity. Notice how this number 89% adds up to the 10.5263 % on the left of it. That 10% number is the proportion of patients that had basal histocytic cells but did NOT have increased lamina propria cellularity.

### 0.6.1 Model Assumptions

The model assumptions for all models are not concerning to the data for visualization. The main requirement is that the data doesn't have a linear correlation between features and that the data is independent, assumed by the unique data points.

Due to the data primarily being categorical, the modifications/assumptions are difficult to decipher.

### 0.6.2 Data Prep for Modeling

#### *Dummy coding the Data*

There are two different set methods, dummy coding and ordinal. Before converting to dummy code, the data is first returned to its original form, then dummy coded to understand the effects of feature reduction and whether it's required.

```
[61]: # convert it back to the original setup
df_reset = cleaned_cases.copy()
df_reset_od = cleaned_cases.copy()
df_reset.head()
```

```
[61]:      Age  Sex  Active inflammation?  Mucosal surface  Crypt architecture  \

### Ordinal Data

Ordinal data is the method of which the data is already set up in. This allows the researchers to put the remaining data types into an ordinal set up for analysis.

```
[68]: ord_cols = ["Severity of Crypt Arch"]
# "Method of confirmation", "Initial pathologists diagnosis", "Observing_
↳ pathologists diagnosis",
```

```
[69]: for val in ord_cols:
    print(val)
    array_un = df_reset_od[val].unique().tolist()
    df_reset_od[val] = df_reset_od[val].apply(lambda x: array_un.index(x))
```

Severity of Crypt Arch

```
[70]: df_ordinal = df_reset_od
df_ordinal.head()
```

```
[70]:      Age  Sex  Active inflammation?  Mucosal surface  Crypt architecture \
