

CapStone B Final WB - Thad

June 6, 2021

0.1 ## Table of Contents

0.1.1 TASKS

1. predicting stage (SVM, Decision Trees, novel model)
2. determining if there is a correlation with the disease and any other characstic (SVM, Decision Trees, novel model)
3. determining whether or not there is any genetic ties (neural networks, novel model) (add this in)
4. determine what type of disease is?
5. Target the same dataset as the related works.

Walter

- ~~Neural Networks (parameter tuning + model + stats + feature reduction) EOW5~~
- statistics/metrics (p-value, t-value, AUC) EOW7

Kris

- ~~Decision Trees (parameter tuning + model + stats + feature reduction) EOW5~~
- discussion EOW7
- conclusion EOW7
- updates to PPT EOW8 (Jamie will help)

Thad

- ~~SVM (parameter tuning + model + stats + feature reduction) EOW5~~
- rewrite of other papers EOW7
- how this affects the community EOW7
- tie back to other papers EOW7

Jamie

- intro EOW4
- ~~explaining data points EOW4~~
- ~~data manipulation (all data related tasks) (reduction method) (reach if needed) EOW3~~
- ~~enhance pre-processing (feature correlations)~~
- ~~visualizations of ML Models (TBD if we have time) very novel EOW~~

- application build EOW8
- create new ML model and visualizations EOW5
- just see if we can find another dataset: found a separate one, too late for change
- create a repo EOW3
- one (minimum) paper for baseline (Walter/Thad will find 2-3 each) EOD Thursday
- feature comparison for Logit & Chi2
- change SMOTE (X_train) & Scaling (X_train & X_Test) after split

0.2 ## Primary Dataset

Cross, Simon S. "Dataset of Observed Features on Endoscopic Colorectal Biopsies from Normal Subjects and Patients with Chronic Inflammatory Bowel Disease (Crohn's disease and Ulcerative Colitis)." Department of Pathology, University of Sheffield Medical School (1999): 1-15

Genetics Summary Statistics Dataset: <https://www.ibdgenetics.org/downloads.html>

East Asian DataSet: <https://academic.oup.com/ecco-jcc/article/12/6/730/4951970#116848212>

0.4.3 Data Manipulation

IBD Stages: Since the stages of UC is determined by the severity of symptoms, the classes are manually added based on symptoms.

Use decision trees to determine

Perhaps find a doctor who can provide some expertise into the stages? - check if this is possible (we would need multiple people to have statistically significance)

Data Transformation Since the data is already dummy coded, the transformation of it will be

required for understanding the outcome after modeling.

```
[12]: transform_dict = [{"data": ["Mucin depletion", "Crypt architecture"],
                        "definitions": [{
                            0: "Normal",
                            1: "Mild",
                            2: "Moderate",
                            3: "Severe"}]},
                        {"data": ["Cryptitis extent", "Crypt abscesses extent"],
                        "definitions": [{
                            0: "None",
                            1: "Little",
                            2: "Moderate",
                            3: "Marked"}]},
                        {"data": ["Lamina propria polymorphs"],
                        "definitions": [{
                            0: "Absent",
                            1: "Focal",
                            2: "Diffuse"}]},
                        {"data": ["Cryptitis polymorphs", "Crypt abscesses_
→polymorphs"],
                        "definitions": [{
                            0: "None",
                            1: "Few",
                            2: "Several",
                            3: "Many"}]},
                        {"data": ["Epithelial changes"],
                        "definitions": [{
                            0: "Normal",
                            1: "Flattening ",
                            2: "Degeneration",
                            3: "Erosion"}]},
                        {"data": ["Mucosal surface"],
                        "definitions": [{
                            0: "Flat",
                            1: "Irregular",
                            2: "Villous projections"}]}]
```

Set Seed for consistency

```
[13]: random.seed(123)
```

Crypt architecture measures the severity of the deformation of the colon, which will also signify at what severity stage the cases are at. This is the column that will be used for determining cases severities.

```
[14]: cleaned_cases['Crypt architecture'].unique()
```

```

crypt_dict = {0:"normal",
              1:"mild",
              2:"moderate",
              3:"severe"}

cleaned_cases['Severity of Crypt Arch'] = [crypt_dict[x] for x in cleaned_cases['Crypt architecture']]

'Severity of Crypt Arch' + 'diagnoses'

```

[14]: 'Severity of Crypt Archdiagnoses'

convert data to object rather than int since these are categorical data.

```

[15]: def change_to_object(df, data_col):

```

0.4.4 Data Cleaning

Clean Diagnosis: Strip data and Upper Case and ensure spelling of all are correct to prevent any separation of classes which are unnecessary.

```
[16]: print(cleaned_cases['Confirmed diagnosis'].unique())
      cleaned_cases['Confirmed diagnosis'] = [c.strip().upper() for c in
      ↪ cleaned_cases['Confirmed diagnosis']]
      print(cleaned_cases['Confirmed diagnosis'].unique())
```

```
['UC' 'Crohns' 'Normal' 'Uc' 'Normal ' 'Crohns ']
['UC' 'CROHNS' 'NORMAL']
```

```
[17]: # cleaned_cases.columns
      # cleaned_cases["Method of confirmation"] = [x if x != "Endosocpy" else
      ↪ "Endoscopy" for x in cleaned_cases["Method of confirmation"]]
      # cleaned_cases["Method of confirmation"].unique()
```

```
[18]: # cleaned_cases['Observing pathologists diagnosis'].unique()
```

```
[19]: # cleaned_cases['Initial pathologists diagnosis'].unique()
      # cleaned_cases['Initial pathologists diagnosis'] = [d if d != "IBD ?Crohn's"
      ↪ else "IBD ?Crohns" for d in cleaned_cases['Initial pathologists diagnosis']]
      # cleaned_cases['Initial pathologists diagnosis'] = [d if d not in
      ↪ ["Non-specific inflammation,chronic", "Non-specific inflammaton, chronic"]
      ↪ else "Non-specific inflammation, chronic" for d in cleaned_cases['Initial
      ↪ pathologists diagnosis']]
      # cleaned_cases['Initial pathologists diagnosis'].sort_values().unique()
```

```
[20]: # cleaned_cases['Year'].sort_values().unique()
```

Missing/Duplicate Data Checks

There is no duplicates data

```
[21]: print(f'IBD duplicates: {cleaned_cases.duplicated().any()}')
```

IBD duplicates: True

There are no missing data values

```
[22]: print(f'IBD missing: {cleaned_cases.isnull().values.any()}')
```

IBD missing: False

0.4.5 Train Test Split

Cross and coworkers randomly shuffled the dataset and split the first 540 cases as the train set and the lasts 269 cases as the test set.

```
[23]: X = cleaned_cases.drop('Confirmed diagnosis',axis=1)
y = cleaned_cases['Confirmed diagnosis']
X_train,X_test,y_train,y_test = train_test_split(X,y,test_size=269,
↳random_state=123)
print(f'Train set has {X_train.shape[0]} rows and test set has {X_test.
↳shape[0]} rows')
```

Train set has 540 rows and test set has 269 rows

Class Imbalance

The minority class of healthy was oversampled so that there were equal diseased as unhealthy classes. This is also reflected in graphs below.

```
[24]: Counter(y_train)
```

```
[24]: Counter({'UC': 305, 'CROHNS': 117, 'NORMAL': 118})
```

```
[25]: # Counter(cleaned_cases['Initial pathologists diagnosis'])
```

EDA

0.5 ##### Jamie

The age is skewed towards the younger generations, and there are outliers of age under 15 and above 85. Since there is no proof that these age groups are errors opposed to only having a low count, they will be left in the data.

```
[26]: plt.figure(figsize=(10,10))
sns.distplot(cleaned_cases.Age.values, bins=50, kde=True)
plt.xlabel('Age', fontsize=12)
plt.show()
```

C:\Users\thads\Anaconda3\lib\site-packages\seaborn\distributions.py:2551:
FutureWarning:

`distplot` is a deprecated function and will be removed in a future version. Please adapt your code to use either `displot` (a figure-level function with similar flexibility) or `histplot` (an axes-level function for histograms).

The data below shows that majority of the cases are from years 90-92 and 95-96. The other years have minimal contribution for years prior to year 90.

```
[27]: # plt.figure(figsize=(10,10))
# sns.distplot(cleaned_cases.Year.values, bins=50, kde=True)
# plt.xlabel('Year', fontsize=12)
# plt.show()
```

While the data is a mixture of both histology and endoscopy, but majority of the confirmation methods are endoscopy.

```
[28]: fig = px.histogram(cleaned_cases, x="Age", color='Sex')
fig.show()
```

Distribution of the dataset, where majority of the classes are UC and the remaining are split to normal and UC roughly evenly.

```
[30]: cd_gb = cleaned_cases.groupby("Confirmed diagnosis").count().reset_index()
fig = px.bar(cd_gb, x='Confirmed diagnosis', y='Sex')
fig.show()
# cd_gb
```

```
[31]: fig = px.histogram(cleaned_cases, x="Age", color='Confirmed diagnosis')
fig.show()
plt.figure(figsize=(10,10))
```

```
[31]: <Figure size 720x720 with 0 Axes>
```

```
<Figure size 720x720 with 0 Axes>
```

0.5.1 correlations

The correlation matrix is show below, which is no the same method which is used for continuous variable, but rather categorical variables.

```
[32]: corr_matrix = cleaned_cases.apply(lambda x : pd.factorize(x)[0]).
      ↪corr(method='pearson', min_periods=1)
corr_matrix.head()
```

```

[5 rows x 25 columns]

We see strong correlations between the symptoms. Specifically, there is a strong correlation between active inflammation and lamina propria polymorphs, which is investigated further below.

Many of the correlations are intuitively connected. For example, cryptis polymorphs and extent, since they are both related to the the fact of where there is inflammation in the linings of the stomach to the morphed cells of the glands.

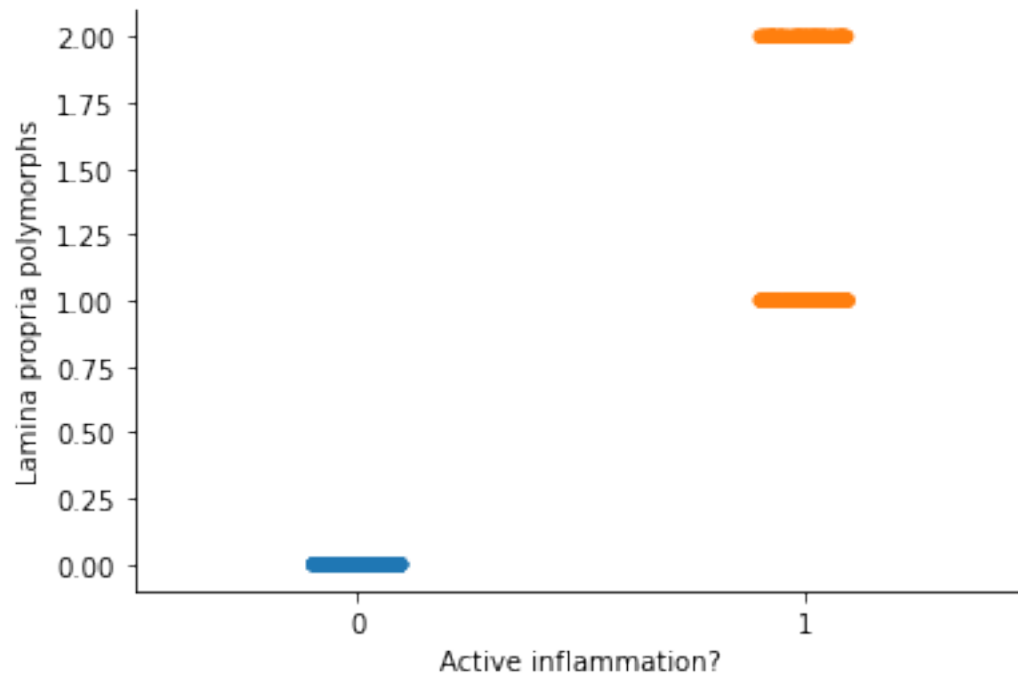

One interesting obervation is the correlation of epithelial changes and the mucin depletions since the epithelial layer concerns the outter layer of the intestine and the mucin depletion primarily concerns with the inner side of the organ.

```
[33]: fig = px.imshow(corr_matrix)
fig.update_yaxes(visible=False, showticklabels=False)
fig.update_xaxes(visible=False, showticklabels=False)
fig.show()
```

Active inflammation and lamina propria polymorphs

Overall, the active inflammation makes sense considering if there is no inflammation, that there in turn would have no polymorphs. Since the inner linings are typically only shows to morph when there is inflammation, this is intuitive in the results.

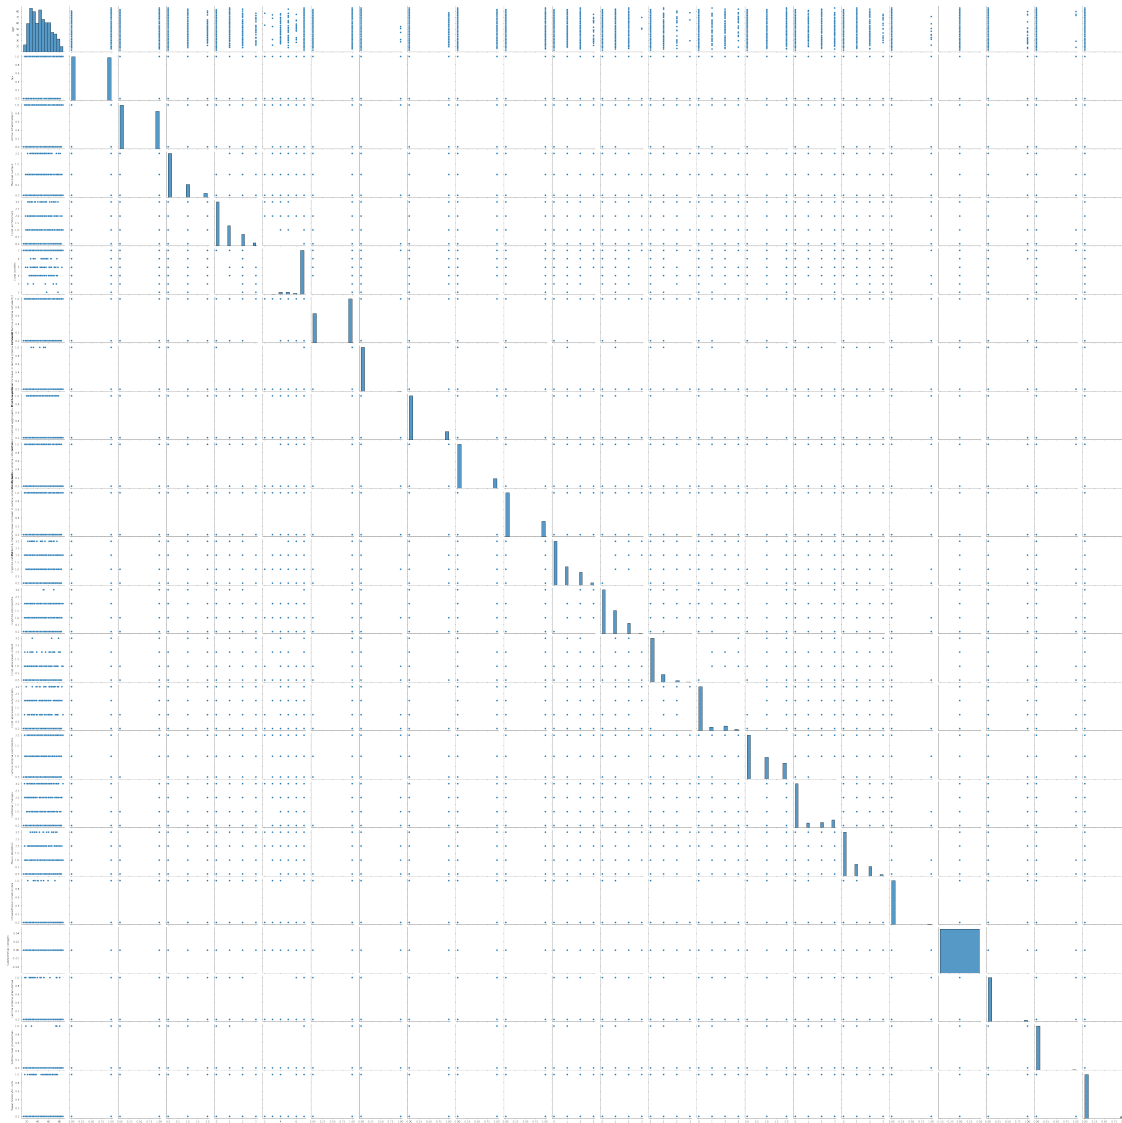

```
[34]: sns.stripplot(x='Active inflammation?', y='Lamina propria polymorphs',
↳data=cleaned_cases, jitter=True)

```

Odds Ratio Odds ratio is a measure of association between an exposure and an outcome. The OR represents the odds that an outcome will occur given a particular exposure, compared to the odds of the outcome occurring in the absence of that exposure. [source](#)

There is no strong correlations between the two, that if a patient is of a specified year and age, there is a 1:1 ratio of the patient being diagnosed with UC of chrohns.

```
[39]: # odds ratio calc
uc_ch = cleaned_cases.loc[cleaned_cases["Confirmed diagnosis"].isin(['UC', 'CROHNS'])]
table_uc = uc_ch[["Confirmed diagnosis", "Age", "Active inflammation?"]].groupby("Confirmed diagnosis").sum()#.values
print(table_uc)
```

```
oddsratio_uc, pvalue_uc = stats.fisher_exact(table_uc)
print("OddsR: ", round(oddsratio_uc,4), "p-Value:", pvalue_uc)
```

For unsupervised EDA, The objective is to find multiple symptoms that are all 1 for the same patients and are all 0 for other patients.

First, manually calculate the risk ratio between Symptom A and Symptom B

Next, create a cross tab where the row is Symptom A, the column is Symptom B and the cell value is the risk ratio of Symptom B / Symptom A

Finally, find the groups of symptoms that have highest risk ratios for one another. If 3 columns have high relative risk ratios, consider keeping only one of those columns and dropping the other 2

Risk Ratio

What is the risk of getting “Increased lamina propria cellularity” if you do have “Lamina propria

granulomas” versus the risk of getting “Increased lamina propria cellularity” if you do not have “Lamina propria granulomas”?

If two symptoms are both positive in 1000 patients. And in another 1000 patients the two symptoms are negative. This would indicate correlation between those 2 symptoms.

```
[52]: exposure = 'Lamina propria granulomas'
disease = 'Increased lamina propria cellularity?'
risks = X_train.groupby([exposure,disease]
                        ).size()/X_train.groupby([exposure]).size()
risks = risks.reset_index()
riskGivenNoExposure = risks.loc[(risks[exposure] == 0)&
                                (risks[disease] == 1),0].values[0]
riskGivenExposure = risks.loc[(risks[exposure] == 1)&
                               (risks[disease] == 1),0].values[0]
riskGivenExposure/riskGivenNoExposure
```

```
[52]: 1.5591715976331362
```

Get the cross tab of every symptom with every other symptom

```
[53]: def multicolumn_crosstab(df,cols):
    cols=sorted(cols)
    dummies = pd.get_dummies(df[cols])

Increased lymphoid aggregates in lamina propria?	0	0.008830

[5 rows x 21 columns]

Which feature is most correlated with the other features? Observe that “Increased lamina propria cellularity” and “Active Inflammation” are the columns that is most correlated with the other symptoms.

noExposureDf: Get all the risks of getting Symptom B given that you dont have symptom A.
 exposureDf: Get all the risks of getting Symptom B given that you do have symptom A.

```
[56]: crossTab      = ct.reset_index()
noExposureDf = crossTab.loc[crossTab['value']=='0']
exposureDf   = crossTab.loc[crossTab['value']=='1']
```

Divide all the risk-given-exposure/ risk-given-no-exposure to get the relative risk for every symptom pair

```
[57]: noExposureDf = noExposureDf.set_index('variable').drop('value',axis=1)
exposureDf      = exposureDf.set_index('variable').drop('value',axis=1)
relativeRisks= exposureDf/noExposureDf
relativeRisks.head()
```

0.6.1 Model Assumptions

The model assumptions for all models are not concerning to the data for visualization. The main requirement is that the data doesn't have a linear correlation between features and that the data is independent, assumed by the unique data points.

Due to the data primarily being categorical, the modifications/assumptions are difficult to decipher.

0.6.2 Data Prep for Modeling

Dummy coding the Data

There are two different set methods, dummy coding and ordinal. Before converting to dummy code, the data is first returned to its original form, then dummy coded to understand the effects of feature reduction and whether it's required.

```
[64]: # convert it back to the original setup
df_reset = cleaned_cases.copy()
df_reset_od = cleaned_cases.copy()
df_reset.head()
```

```

Ordinal Data

Ordinal data is the method of which the data is already set up in. This allows the researchers to put the remaining data types into an ordinal set up for analysis.

```
[70]: ord_cols = ["Severity of Crypt Arch"]
      # "Method of confirmation", "Initial pathologists diagnosis", "Observing_
      ↪ pathologists diagnosis",
```

```
